A World for Digital Life

What is Thought AI Fabric?

Data is a digital ocean, but it is currently a stagnant mass. Thought AI is a revolutionary technology that turns data into digital life. Individual bits of data become wrapped with AI, becoming lifeforms called Nuances that are self-aware, and follow patterns of nature to group together into Swarms. Nuances are Thought's special brand of agents, unlike any other agent-based AI technology because of how granular and detailed it can get, due to Thought's patented data-wrapping technology. The virtual world that contains digital life is called Thought Fabric.

The possibilities for this new type of technology are nearly endless. Thought patented this self-aware technology all the way back in 2013, and has been building out private use cases for agriculture, energy, and aerospace. Soon, a public platform for training and interacting with agents will go live and change the world as we know it.

While OpenAI, Google, and Microsoft have been running away whenever unintended advancements occur, Thought AI has meticulously blazed a trail and put up safety barriers and standards for others to follow. Welcome to a world of thinking & thriving Artificial General Intelligence.
